## 설계사양서

멀티미디어공학과 Tree조 0791081-장진우 0791057-김현원

- ▷ 입력받은 수입, 지출 값을 통해 계산.
- ▷ 입력받은 날짜, 내역, 계산된 수입, 지출, 밸런스 값 출력.

```
class Account // 클래스선언
        string s_Date; // 멤버변수선언
        string s_Item;
        static int i_Tot; // static 멤버변수
public:
        int i_Inc;
        int i_Exp;
        int i_Bal;
        Account(); // 생성자
        void set_Account(string date, string item, int income, int expense); //
멤버함수원형
        void out_Data();
};
Account::Account() // 생성자정의
        i Bal = 0;
}
void Account::set_Account(string date, string item, int income, int expense) //
멤버함수정의
        i_Bal = i_Tot;
        s_Date = date;
        s Item = item;
        i_Inc = income;
        i_Exp = expense;
        i_Bal += income; // i_Bal = i_Bal + income;
        i_Bal -= expense; // i_Bal = i_Bal - expense;
        i_Tot = i_Bal;
}
void Account::out_Data()
        cout <<" | "<< setw(10) << fixed << s Date;
        cout <<"|"<< setw(16) << fixed << s_Item;</pre>

        cout <<"|"<< setw(16) << fixed << i_Exp;</pre>
        cout <<" | "<< setw(16) << fixed << i_Bal << " | "
```

- ▷ 전체 입력할 건수 입력받음.(동적메모리 할당)
- ▷ 건수에 따라 차례로 각 데이터 입력받음.(for loop로 반복)
- ▷ 전체 계산된 값 출력.

```
